                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is the amino acid sequence of the human tumour necrosis factor receptor-like protein splice variant 1 (TRIISV1 receptor). The invention credates to TRII and two splice variants TRIISV1 and TRIISV2. The nuclectide sequences were determined by sequencing cloned cDNAs and 15 sequencing cloned contract cloned cloned
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              eye disease, anaphylaxis, hypersensitivity to an antigenic molecule, organ rejection or graft versus host disease, inflammatory conditions, ischaemia-reperfusion injury, complement-mediated hyperacute rejection, nephritis, cytokine or chemokine induced lung injury, inflammatory bowel disease, Crohn's disease, hyperproliferative disorders, or infections.
Tumour necrosis factor receptor-like protein; TRI1; TRI1SV1; GITR; growth; differentiation; cell death; immune deficiency disorder; bigeorge syndrome; HIV; SCID; Wiskott-Aldrich disorder; anaemia; Stiff-Man syndrome; arthritis; multiple sclerosis; diabetes; Alzheimer's disease; Parkinson's disease; Huntingdon's disease; inflammatory condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New tumour necrosis factor receptor-like polypeptides used to, e.g.

                                                      protein from clone_A8. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of hematopoletic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                          Gaps
                                               This is the amino acid sequence of the truncated human 312C2 T cell
e.g. cancers, auto-immune disorders, transplantation rejection and other \tau cell disorders

receptor-like protein TRII, a nowel 25 kpa protein which shows 58.6% identity to murine glucocorticoid induced tumour necrosis factor receptor family-related gene. The sequence was deduced from a cDNA clone (see AAA50304) discovered in a T-helper cell library. TRII activated NF-kappaB through a TRAF2-mediated mechanism characterization-inducible. The TRII ligand is constitutively expression is activation-inducible. The TRII ligand is constitutively expressed in an endothelial cell line. This suggests that TRII and its ligand may be involved in activated T-cell trafficking. The invention provides TRII, TRIISVI and TRIISV2 notclet acids (see AAA50304-06) and highly conserved encoded proteins (see Contine TRII, TRIISVI and/or TRIISV2 polypeptides are useful their production. TRII, TRIISVI and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency, contined agammaglobulinemia, severe combined immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (SCID), Wiskott Andrich syndrome or X-linked immunoglobuling deficiency with hyper IgM. TR11, TR11SV1 and/or TR11SV2 deficiency with hyper IgM. TR11, TR11SV1 and/or TR11SV2 antagonists (e.g. antibodies) are used to treat, prevent, prognose and/or diagnose an autoimmune disease, especially rheumatoid arthritis, systemic lupus erythematosus, thrombocytopenia purpura or IgA mephropathy. The polypeptides, polynocleotides and/or antibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicellular organism. Soluble forms of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a molecule associated with cell proliferation, MACP-5 from Incyte clone 2809903 isolated from TLYMNOT06 cDNA library. This sequence is expressed in cardiovascular and haematopoletic/immune tissues. MACP shows antiarteriosclerotic, antiarthy hepatotropic, antiinflammatory, antipsoriatic, cytostatic, antiasthmatic, dermatological, antidiabetic, nephrotropic, antithyroid, thyromimetic, immunosuppressive, osteopathic, antiarthitic, uropathic, antiulier, and ophthalmological activities. The present sequence is useful in the activite keratosis, treatment and prevention of cell proliferative disorders e.g. actinic keratosis, arterlosclerosis, atherosclerosis, bursitis and hepatitis, and immune disorders e.g. Crohn's disease, amyloidosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polypeptides and polynucleotides useful for treating and detecting cell proliferation disorders e.g. actinic keratosis, and immune disorders e.g. Crohn's disease

                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            receptor-like protein (TRII receptor). The invention relates to TRII and two splice variants TRIISV1 and TRIISV2. The nucleotide sequences were determined by sequencing cloned cDNAS AA237765-Z37766. The TRII receptor and its splice variants show homology to the murine glucocorticoid induced tumour necrosis factor receptor family-related gene (GITR). TRII, TRIISV1 and TRIISV2 polypeptides may be involved in the regulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tumour necrosis factor receptor-like protein (TR11) amino acid sequence.

Digeorge syndrome, HIV infection, severe combined immunodeficiency (SCID), Wiskott-Aldrich disorder, blood coagulation disorders, blood platelet disorders or wounds resulting from trauma or surgery. They can also be used to treat heart attacks, strokes, Addison's disease, haemolytic anaemia, rheumatoid arthritis, Goodpastures syndrome, Grave's disease, multiple sclerosis, myasthenia gravis, Stiff-Man syndrome, systemic lupus erythematosus, Guillain-Barre syndrome, insulin dependent diabetes mellitus or autoimmune inflammatory eye disease, anaphylaxis, hypersensitivity to an antiqenic molecule, organ rejection or graft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 versus host disease, inflammatory conditions, ischaemia-reperfusion injury, complement-mediated hyperacute rejection, nephritis, cytokine or chemokine induced lung injury, inflammatory bowel disease, Crohn's disease, hyperproliferative disorders, or infections. They can also be used to repair, replace, or protect tissue damaged by congenital defects, trauma, age, disease, surgery, including cosmetic plastic surgery, fibrosis, reperfusion injury, peripheral nerve injuries, neuropathies, and central nervous system disease (e.g. Alzhelmer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager syndrome). The products can also be used for
of cell-type specific receptor-mediated cell growth, differentiation, and ultimately, cell death. They can be used for screening for agonists. The polypeptides, agonists or antagonists can be used for treating a disease state associated with aberrant cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; molecule associated with cell proliferation; MACP-5; Incyte clone 2809903; antiarteriosclerotic; hepatotropic; cytostatic; anti-inflammatory; antipsoriatic; anti-HIV; antiasthmatic; anaemia; dermatological; antidabetic; nephrotropic; antithyroid; thyromlmetic; immunosuppressive; osteopathic; antiatthritic; uropathic; antiulcer; ophthalmological; diagnosis; treatment; prevention; immune disorder; cell proliferative disorder; actinic keratosis; arteriosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                          survival. They can be used for treating immune deficiency disorders,

                                                                                                                                                                                                                                                                                                                                                                                                                         This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytckine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.

The present sequence represents human PRO364, a novel member of the tumour necrosis factor receptor family. The sequence was deduced from a bone marrow cDNA clone (see AAX87670). Methods for the recombinant production of PRO364 polypeptides. e.g. in CHO.

Escherichia coli or yeast host cells, are provided. Claimed or polypeptides comprise amino acids 1.241, 1.x, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid respites 157-167 of PRO364. PRO364 polypeptides re useful for modulating apoptosis, NF-KB activation and proinflammatory or autoimmune responses in mammalian cells proinflammatory or autoimmune responses in mammalian cells (claimed). Chimeric molecules comprising a PRO364 polypeptide immunoglobulin For region are also claimed. PRO364 polypeptide immunoglobulin For region are also claimed. PRO364 polypeptides in theractions. This is useful for identifying inhibitors or agonists of receptor/ligand binding. The PRO364 polypeptides may also be combined with an agent that is cytotoxic, chemotherapeutic methods, purification methods and also in therapy, e.g. as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            XXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                         factor receptor family-related gene. The sequence was deduced from a cDNA clone (see AAAS0306) discovered in an activated T-cell library. The invention provides TRI1, TRIISVI and TRIISV2 nucleic acids (see AAA50304-06) and highly conserved encoded proteins (see AAA50819-81), as well as vectors, host cells and recombinant methods for their production. TRI1, TRIISVI and/or TRIISV2 polypeptides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tumour necrosis factor receptor-like protein; TR11; TR11SV1; TR11SV2; GITR; growth; differentiation; cell death; immune deficiency disorder; Digeorge syndrome; HUY, SCID; Wiskott-Aldrich disorder; anaemia; Stiff-Man syndrome; arthritis; multiple sclerosis; diabetes; Alzheimer's disease; Parkinson's disease; Huntingdon's disease;
                                          Human tumor necrosis factor receptor-like proteins useful for diagnosis, prevention and treatment of disease states associated with aberrant cell survival such as autoimmune disease and rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                              for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency, X-linked agammaglobulinemia, severe combined immunodeficiency (SCID), Wiskott-Allarich syndrome or X-linked immunodeficiency deficiency with hyper igm TRIISV1 and/or TRIISV2 antagonists (e.g. antibodies) are used to treat, prevent, prognose and/or diagnose an autoimmune disease, especially rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          arthritis, systemic lupus erythematosus, thrombodytopenia purpura or IgA nephropathy. The polypeptides, polynucleotides and/or antibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicellular organism. Soluble forms of the polypeptides may also be used. Methods for screening for agonist/antagonist compounds are also provided.
                                                                                                                                                                                                    The present sequence is that of human tumour necrosis factor receptor-like protein TR11SV2, a novel 26 kDa protein which shows 58.6% identity to murine glucocorticoid induced tumour necrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

Trists the amino acid sequence of the human tumour necrosis factor creates to TRII and two Splice variant 2 (TRIISV2 receptor). The invention relates to TRII and two Splice variants TRIISV1 and TRIISV2. The invention sequences were determined by sequencing cloned contact of nucleotides sequences were determined by sequencing cloned contact of A237765-237766. The TRII receptor and its splice variants show homology comparing the murine glucocorticoid induced tumour necrosis factor receptor family related gene (GTTR). TRII. TRIISVI and TRIISV2 polypeptides may be involved in the requilation of cell-type specific receptor-mediated coused for screening for agonists/Antagonists. The polypeptides may be involved in the requilation of cell-type specific receptor-mediated conservant cell survival. They can be used for treating a disease state associated with aberrant cell survival. They can be used for treating immune deficiency disorders, blood platelet disorders or wounds resulting from trauma or surgery. They can also be used to treat heart attacks, strokes, Addison's disease, haemolytic anaemala, rheumatoid arthritis, Goodpastures syndrome, systemic lupus erythematosus, Guillain-Barre corpus crythematory systemic lupus erythematosus, Guillain-Barre syndrome, systemic lupus erythematosus, Guillain-Barre corpus rejection or garft versus host disease, inflammatory conditions, isohaemia-reperfusion injury, complement-mediated hypersocute rejection, isoharial defects, trauma, age, disease, inflammatory conditions. They can also be used to repair, replace, or protect tissue damaged by congenital defects, trauma, age, disease, inflammatory sortic plastic surgery, including cosmetic plastic surgery, they can also be used to repair, replace, or protect tissue damaged by comparines, neuropathies, and central nervous system disease, profiles and sentence of alsoese, Parkinson's disease, Huntington's disease, Parkinson's disease, Huntington's disease, Parkinson's and sentence or syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to methods for stimulating or inhibiting and cardiovascularization. The methods involve the use of pharmaceutical compositions beased on the following proteins, PRO179, PRO384, PRO844, PRO846, PRO1760, PRO205, PRO331, PRO331, PRO847, PRO879, PRO882, PRO885 or PRO887. These proteins were identified by isolating cDNA clones encoding secreted proteins. The proteins of the invention may be used to diagnose and treat cardiovascular, endothelial or angiogenic disorders. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                             useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with imappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosolerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB24435 represent nucleotide and protein sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         neoplastic cell growth inhibitor; cytostatic; treatment; cancer; tumour; breast; prostate; colon; lung; renal; ovarian; central nervous system; CNS; leukemia; melanoma; Expressed Sequence Tag; EST; TNFR homologue; tumour necrosis factor receptor; GITR protein homologue.

It is isolated from human small intestine tissue cDNA ilbrary, identified using probes based on the consensus sequence DNA4825. relative to the Incyte expressed sequence tag (EST) 3003460. This EST has homology to tumour necrosis factor receptor (TNRN) family of polypeptides. PRO364 sequence also shows homology to members of the TNRR family, and mouse GITR protein. This clone is assigned the ATCC deposit No: 209436. PRO364 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PRO555, PRO364 and PRO344. This composition is especially useful for treatment of human cancers such as breast, prostate, colon, lung, renal, ovarian and CNS, leukemia and melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            receptor-like protein TRISY1, a novel 56 kba protein which shows receptor-like protein TRISY1, a novel 58 kb identity to murine glucocorticoid induced tumour necrosis factor receptor family-related gene. The sequence was deduced from cDNA (see AAA50305) discovered in a PHA-stimulated T-cell library. The invention provides TRI1, TRIISV1 and TRIISV2 nucleic acids (see AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) and highly conserved encoded proteins (see that production. TRI1, TRIISV1 and/or TRIISV2 polypeptides are useful their production. TRI1, TRIISV1 and/or TRIISV2 polypeptides are useful immunodeficiency, sepecially common variable immunodeficiency.

7. Linked agammaglobulinemia, severe combined immunodeficiency (SCID), wiskott-Aldrich syndrome or X-linked immunodeficiency antagonists (e.g. antibodies) are used to treat, prevent, prognose an autoimmune disease, especially rheumatoid

                                                                             receptor-like grotein TRII (see also AAY95879), a novel protein showing identity to murine glucocorticoid induced tumour necrosis factor receptor family related gene. The invention provides highly conserved TRII, TRIISVI and TRIISV2 proteins (see AAY95879-81), as well as vectors, host cells and recombinant methods for their production. TRII, TRIISVI and/or TRIISV2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                      (SCID), Wiskott-Aldrich syndrome or X-linked immunoglobulin deficiency with hyper IgM. TRAISVI and/or FRIISVS antagonists (e.g. antibodies) are used to treat, prevent, prognose and/or diagnose an autoimmune disease, especially rheumatoid

They can also be used to repair, replace, or protect tissue damaged by congenital defects, trauma, age, disease, surgery, including cosmetic plastic surgery, fibrosis, reperfusion injury, peripheral nerve injuries, neuropathies, and central nervous system disease (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager syndrome). The products can also be used for detection, diagnosis and prognosis.

This is the amino acid sequence of the human tumour necrosis factor
receptor-like protein splice variant 1 (TRIISVI receptor). The invention
relates to TRII and two splice variants TRIISVI and TRIISV2. The
uncleotide sequences were determined by sequencing cloned cDNAs
AZ37765-Z37766. The TRII receptor and its splice variants show homology
AZ37765-Z37766. The TRII receptor and its splice variants show homology
to the murine glucocorticoid induced tumour necrosis factor receptor
family related gene (GITR). TRII, TRIISVI and TRIISV2 polypeptides may
be involved in the requilation, and ultimately, cell death. They can be
used for screening for agonists/Antagonists. The polypeptides, agonists
or antagonists can be used for treating a disease state associated with
aberrant cell survival. They can be used for treating immune deficiency
cal disorders blood platelet disorders or wounds resulting from trauma or
disorders, blood platelet disorders or wounds resulting from trauma or
climunodeficiency (SCID), Wiskott-Aldrich disorder, blood coagulation
disorders, blood platelet disorders or wounds resulting from trauma or
surgery. They can also be used to treat heart attacks, strokes,
also fave seed in the memolytic anamia, rheumatoxid arthritis, Goodpastures
Syndrome, Grave's disease, multiple sclerosis, maschhenia gravis,
stiff-Man syndrome, systemic lupus erythematosus, Guillain-Barre

                                                                                                                                                                                                                                                                  ö
                                                                        protein from clone_A8. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Bngagement of 312C2 stimulates proliferation of T cells clones, antigan-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of heematopoletic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the amino acid sequence of the human 312C2 T cell protein from clone_A5, which is identical to sequence AAW37838 for the first 105 amino acid residues. It is thought that divergence may be due to an unspliced intron. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human 312C2 T cell protein; thymus cell; spleen cell; T cell;

                                                                                                                                                                                                                                                           Gaps
antigen-specific proliferation and cytokine production by T-cells, potentiates T cell expansion or apoptosis. The products can be use in the treatment of conditions associated with abnormal physiology
                                                          development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of heematopoietic cells, e.g. lymphoid which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                                                                           ö

The present sequence is a molecule associated with cell proliferation, MACP-5 from Incyte clone 2809903 isolated from TLYMNOTO6 cDNA library. This sequence is expressed in cardiovascular and haematopoidetic/immune tissues. MACP shows antiarteriosclerotic, anti-HIV, hepatotropic, antinflammatory, antipsoriatic, cytostatic, antiasthmatic, dermatological, antidiabetic, nephrotropic, antithyroid, thyromimetic, immunosuppressive, osteopathic, antiarthritic, uropathic, antiulcer, and ophthalmological activities. The present sequence is useful in the diagnosis, treatment and prevention of cell proliferative disorders e.g. actinic keratosis, arteriosclerosis, atherosclerosis, bursitis and hepatitis, and immune disorders e.g. Crohn's disease, amyloidosis and
                                                                                                                                                                                                                                                                                                                                                                                                             Polypeptides and polynucleotides useful for treating and detecting cell proliferation disorders e.g. actinic keratosis, and immune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human 312C2 T cell protein; thymus cell; spleen cell; T cell;

This is the amino acid sequence of the human tumour necrosis factor receptor-like protein (TRII receptor). The invention relates to TRII and two splice variants TRIISV1 and TRIISV2. The nucleotide sequences were determined by sequencing cloned CONAS AB277765.237766. The TRII receptor and its splice variants show homology to the murine glucocorticoid induced tumour necrosis factor receptor family-related gene (GITR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TRII, TRIISVI and TRIISV2 polypeptides may be involved in the regulation of cell-type specific receptor-mediated cell growth, differentiation, and uttimately, cell death. They can be used for screening for agonists/antagonists. The polypeptides, agonists or antagonists can be used for treating a disease state associated with aberrant cell survival. They can be used for treating immune deficiency disorders, placeorge syndrome, HIV infection, severe combined immunodeficiency (SCID), Wiskott-Aidrich disorder, blood coagulation disorders, blood platelet disorders or wounds resulting from trauma or surgery. They can also be used to treat heart attacks, strokes, Addison's disease,
                                                                                                                                                                                                                          Tumour necrosis factor receptor-like protein (TR11) amino acid sequence.
                                                                                                                                                                                                                                                  Tumour necrosis factor receptor-like protein; TR11; TR11SV1; GITR; growth; differentiation; cell death; immune deficiency disorder; Digeorge syndrome; HIV; SCID; Wiskott-Aldrich disorder; anaemia; Stiff-Man syndrome; arthritis; multiple sclerosis; diabetes; Alzheimer's disease; Parkinson's disease; Huntingdon's disease; inflammatory condition.

                                                                                                                                                                                                                                                                                              Novel PRO polypeptides and agonists and antagonists of them, used to diagnose and treat cardiovascular, endothelial and angiogenic disorders
                                                                                                                                                                                                                                                                                                                                                    The present invention relates to methods for stimulating or inhibiting anglogenesis and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following proteins, PRO179, PRO284, PRO844, PRO846, PRO1760, PRO205, PRO321, PRO333, PRO640, PRO877, PRO876, PRO879, PRO882, PRO885 or PRO887. These proteins were identified by isolating cDNA clones encoding secreted proteins were identified by invention may be used to diagnose and treat cardiovascular, endothelial or anglogenic disorders. The present sequence is one of the proteins of the invention.
                                                                                                                                                                                                                                     Pitti RM;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; Immune related disease; diagnosis; antiinflammatory; cardiant; dermatological; antiarthritic; antirheumatic; immunosuppressive; haemostatic; antithyroid; antidiabetic; nootropic; neuroprotective; antianaemic; hepatotropic; virucide; antipsoriatic; antiallergic; antiasthmatic; systemic lupus erythematosus; rheumatoid arthritis;

The present sequence represents human PRO364, a novel member of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        tumour necrosis factor receptor family. The sequence was deduced from a bone marrow cDNA clone (see AAX87670). Methods for the recombinant production of PRO364 polypeptides, e.g. in CHO. Bscherichia coli or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-x, 26-241 (i.e. the mature protein) and 26-x of the present sequence, where X is any one of amino acid respidas 157-167 of PRO364. PRO364 polypeptides are useful for modulating apoptosis, NF-KB activation and proinflammatory or autoimmune responses in mammalian cells fused to a heterologous sequence souprising a PRO364 polypeptide fused to a heterologous sequence comprising a PRO364 polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                immunoglobulin Fc region are also claimed. PRO564 can be used in assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or agonists of receptor/ligand binding. The PRO364 polypeptides may also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PRO364 antibodies are useful in diagnostic methods, purification methods and also in therapy, e.g. as
                                                                                                                                                                                                                                                                                                                                                                                                     Tumour necrosis factor receptor homologue - useful for, e.g. modulating apoptosis and NF-KB activation and proinflammatory or autoimmune responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cardiovascular; endothelial; angiogenic disorder; PR0179; PR0238; PR0364; PR0844; PR04760; PR0205; PR0321; PR0333; PR0840; PR0877; PR0878; PR0879; PR0882; PR0885; PR0887;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 313C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apportosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                     useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or anglogenic disorder in mammals by modulating cell proliferation, anglogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with imappropriate PRO expression such as cardiovascular, endothelial or anglogenic disorders in mammals (e.g. atherosolerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors conclaining them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB24435 expression to the protein sequences used in the exemplification of the present invention.
                                                                                   Goddard A;
                                                                                                                                                                                                                                                                                                                                                        The present invention describes nucleic acids encoding PRO polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                          Nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or anglogenic disorders in mammals -

It is isolated from human small intestine tissue cDNA library, identified using probes based on the consensus sequence DNA44825, relative to the Incyte expressed sequence Ltg (EST) 3003460. This EST has homology to tumour necrosis factor receptor (TNRN) family of polypeptides. PR0364 sequence also shows homology to members of the TNFR family and mouse GITR protein. This clone is assigned the ATCC deposit No: 209436. PR0364 functions as an eoptastic cell growth inhibitor and is used for treating tumours, using an effective amount of PR0565, PR0364 and PR0344. This composition is especially useful for treatment of human cancers such as breast,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosting immune related discretes. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related discretes. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, solected from systemic ladopathic inflammatory myopathies, Sjoyene's systemic sclerosis, idopathic inflammatory myopathies, Sjoyene's systemic sclerosis, idopathic inflammatory morphises, Sjoyene's anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases of inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune-mediated skin diseases, allergic diseases, allergic diseases, allergic diseases, and transplantation associated diseases including graft rejection and graft-versus-host-disease.

AACSB379 to AACSB378 represent PRO primers and hybridisation probes used the isolation of human PRO polynucleotide and protein sequences glven in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; PRO; promotion; inhibition; angiogenesis; cardiovascularisation;
                                                 showing identity to murine glucocorticoid induced tumour necrosis factor receptor family-related gene. The invention provides highly conserved TRII, TRISVI and TRIISV2 proteins (see AAV95879-81), as well as vectors, host cells and recombinant methods for their production. TRII, TRIISVI and/or TRIISV2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, sepecially common variable immunodeficiency, X-linked agammaglobulinemia, severe combined immunodeficiency, (SCID), Wiskott-Aldrich syndrome or X-linked immunodeficiency antabonists (e.g. antibodies) are used to treat, prevent, prognose and/or diagnose an autoimmune disease, especially rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                      arthritis, systemic lupus erythematosus, thrombocytopenia purpura or 1gA nephropathy. The polypeptides, polynuclectides and/or antibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicellular organism. Soluble forms of the polypeptides may also be used. Methods for screening for
The present sequence is that of human tumour necrosis factor receptor-like protein TR11 (see also AAY95879), a novel protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

This sequence represents PR0364 polypeptide, which is a human glucocorticoid-induced tumor necrosis factor receptor (hGITR). The corresponding ligand (hGITRL), PR0175, is given in ARA47056.

PR0364 and PR02175 may be used in a mixture with a cardiovascular, endothelial, anglogenic or anglostatic agent for the treatment of a cardiovascular, endothelial, anglogenic or anglostatic disorder. The PR0364 cDNA sequence was isolated from an expressed sequence tag (EST) database as having homology to members of the tumour necrosis factor receptor (TNFR) family of polypeptides. The PR0175 cDNA sequence was isolated from a library of cDNA fragments derived from human umbilical veln endothelial cells (HUVEC). Administering an effective amount of PR0364 or PR0175 or their antagonists is useful for treating cardiac hypertrophy (which is initiated by myocardial infarction and characterized by the presence of an elevated level of PGF_2alpha), trauma, a cancer, or age-related macular degeneration in a human. Administering a therapeutically effective amount of an antibody that binds PR0364 or PR0175 in a human suffering from a tumor or a retinal disorder. PR0364 or PR0175, or their antagonists, are useful for tweetunes. Expended drug targeting or as therapeutic targets for the treatment or prevention of atherosclerosis, hypertension, inflammatory vascular-related drug targeting or as therapeutic targets for the thrombophlebitis, tumor anglogenesis, periodontal diseases, antersensing and peripheral nervous attraction or begeneration and treatment of bung or liver fibrosis, periodontal diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                              Composition for diagnosing and treating cardiovascular, endothelial and anglogenic disorders, comprises a PRO364 or PRO175 polypeptide -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; PRO; antlinflammatory; dermatological; antiarthritic;

The present sequence is one of thirty three novel PRO polypeptides.
The PRO polypeptides, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related alsorders such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's systemic vacculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems (such as multiple sclerosis, idiopathic demyelinating polyneuropathy or Guillain-Barre syndrome, and chronic inflammatory demyelinating polyneuropathy, hepatobiliary diseases (such as inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's diseases, eurthema multiforme, contect dermatitis, psoriasis).

The properties of the sasthma, allergic rhinitis, atopic dermatitis, food hypersensitivity and urticaria), immunological diseases of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Godowski PJ, Gurney AL;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of novel human immunomodulator PR0364 (M00319), as deduced from cDNA (see AAF30057) isolated from a small intestine library. PR0364 (26 kDa, pI 6.34) shows sequence homology to mouse GITR protein and may be its human counterpart.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        "prokaryotic membrane lipoprotein lipid attachment site"

craimed compositions comprising trace proteins of trainmed compositions comprising the proliferation of inflammatory cells into a tissue of a mammal, stimulating or enhancing an immune tissue of a mammal, stimulating or enhancing an immune response to an antigen. Claimed compositions comprising a PRO polypeptide or its antagonist have the opposite effect. A calaimed method for treating an immune related disorder, such as a T cell disorder, involves administering a PRO polypeptide, an agonist antibody or an antagonist antibody. The disorder is selected from antibody or an antagonist antibody. The disorder is selected from antibody or an antagonist antibody. The disorder is selected from antibody or an antagonist antibody. The disorder is selected from antibody or an antagonist antibody. The disorder is selected from antibody or an antagonist antibody. The disorder is selected from antibody or an antagonist antibody. The disorder is selected from a prolifer arthritis, spondyloarthropathy, systemic selected from a califormy antibodiated disorder, dispeting antibodiated arthritis, sarcoidosis, autoimmune chronic active hepatitis, primary biliary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel disease (ulcerative colitis and Crohn's disease), gluten-sensitive disease (such as asthma, allergic rhintis, atopic dermatitis, food hypersensitivity and urticaria), immunologic dermatitis, food hypersensitivity and urticaria), immunologic diseases (such as asthma, allergic rhintis, atopic can diseases (such as asthma, allergic rhintis, atopic callerder of expression of the PRO gene. Also claimed are a method of diagnosing these disorders comprise detecting and anterhod of the PRO polypeptide, vectors, host cells, antibodies, and an anthod of stimulating the proliferation of T lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PRO364; human; glucocorticoid-induced tumor necrosis factor; receptor; hGITR; 11gand; hGITR; pRO175; tumour necrosis factor receptor; TNFR; human umbilical vein endothelial cell; HUVEC; cardiac hypertrophy; myocardial infarction; PGF_2alpha; trauma; cancer; anglogenesis;

(SCID), Wiskott-Aldrich syndrome or X-linked immunoglobulin deficiency with hyper IgM. TRIIS'I and/or TRIIS'S antagonists (e.g. antibodies) are used to treat, prevent, prognose and/or diagnose an autoimmune disease, especially rheumatoid
                                                                            arthritis, systemic lupus erythematosus, thrombocytopenia purpura or 1gA nephropathy. The polypeptides, polynucleotides and/or antibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicellular organism. Soluble forms of the polypeptides may also be used. Methods for screening for agonist/antagonist compounds are also provided.
                                                                                                                                                                                                                                                                                                                                                                                                  ö

This is the amino acid sequence of the human tumour necrosis factor
receptor-like protein (TRI1 receptor). The invention relates to TRI1 and
two splice variants TRISV1 and TRIISV2. The nucleotide sequences were
determined by sequencing cloned cDNAS AA237765-237766. The TRI1 receptor
and its splice variants show homology to the murine glucocorticoid
induced tumour necrosis factor receptor family-related gene (GITR).

TRIISV2 and TRISV2 bolypeptides may be involved in the regulation
of cell type specific receptor-mediated cell growth, differentiation,
and ultimately, cell death. They can be used for screening for
agonists/Antagonists. The polypeptides, agonists on thagonists can be
carrival. They can be used for treating immune deficiency disorders,
bigeorge syndrome, HIV infection, severe combined immunodeficiency
(SCID), wiskott-Aldrich disorder, blood coagulation disorders, blood
platelet disorders or wounds resulting from trauma or surgery. They can
also be used to treat heart attacks, strokes, Addison's disease,
haltple sclerosis, mysthenia gravis, Stiff-Man syndrome,
also be used to treat heart attacks, strokes, Addison's disease,
conclusion and an artiganic anthritis, Goodpastures syndrome, Insulin dependent

Polypeptides and polynucleotides useful for treating and detecting cell proliferation disorders e.g. actinic keratosis, and immune disorders e.g. Crohn's disease Claim 1; Pages 64-65; 67pp; English.

The present sequence is a molecule associated with cell proliferation, MACP-5 from Incyte clone 2809903 isolated from TLYMNOT06 cDNA library. This sequence is expressed in cardiovascular and haematopoletic/immune tissues. MACP shows antiarteriosclerotic, anti-HIV, hepatotropic, antiinflammatory, antiaberic, antiatistic, antiabetic, nephrotropic, antiinflyod, thyromimetic, farmannosuppressive, osteopathic, antiathoric, antiathyroid, thyromimetic, and ophthalmological activities. The present sequence is useful in the diagnosis, treatment and prevention of cell proliferative disorders e.g. actinic keratosis, arteriosclerosis, atherosclerosis, bursitis and hepatitis, and immune disorders e.g. Crohn's disease, amyloidosis and

This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Bngagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates 'T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells
                                                                                                                           Human 312C2 T cell protein; thymus cell; spleen cell; T cell; antigen-specific T cell proliferation; cytokine production by T-cell; apoptosis; cancer; haematopoietic cells; lymphoid cell;

                                           This is the amino acid sequence of the truncated human 312C2 T cell protein from clone_A8. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the requisitive conditions of degenerative conditions.

AAY95879-81), as well as vectors, host cells and recombinant methods for their production. TR11, TR11SV1 and/or TR11SV2 polypeptides are useful immunodeficiency, especially common variable immunodeficiency, sepecially common variable immunodeficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           factor receptor family-related gene. The sequence was deduced from a cDNA clone (see AAA50304) discovered in a T-helper cell library. TRI1 activated NF-kappaB through a TRAF2-mediated mechanism. Expression is activation-inducible. The TRI1 ligand is constitutively expressed in an endothelial cell line. This suggests that TRI1 and its ligand may be involved in activated T-cell trafficking. The invention provides TRI1, TRI1SV1 and TRI1SV2 nucleic acids (see AAA50304-06) and highly conserved encoded proteins (see

The PRO polypeptides, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosins manner related antagonists are useful for treating and diagnosing immune related disorders such as systemic lupus erythematosus, rheumatoid arthritis, osteoathritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's systemic vasculities, aercoidosis, autoimmune haemolytic and peripheral nervous systems (such as multiple sclerosis, idiopathic immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems (such as multiple sclerosis, idiopathic inflammatory demyelinating polymeuropathy), hepatobiliary diseases inflammatory demyelinating polymeuropathy), hepatobiliary diseases confined as infectious, autoimmune chronic active hepatitis, primary billary cirrhosis, granulomatous hepatitis and sclerosing cholangitis), inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune or immune-mediated skin diseases (such as bullous skin diseases such as asthma, allergic rhinitis, atopic dermatitis, allergic diseases such as asthma, allergic rhinitis, atopic dermatitis, con hypersensitivity and urticaria), immunological diseases of the lung (such as eoslnophilic pneumonias, idiopathic pulmonary fibrosis and hypersensitivity pneumonials), transplantation associated diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .;

RESULT 15

(first entry)

21-MAR-2001

XXXXXX

AAB50982;

Human PRO364 protein

The present sequence is one of seventeen novel PRO polypeptides. The PRO nucleic acids, polypeptides, aganists and antagonists are useful for treating cardiovascular, endothelial or angiogenic disorders in a mammal. Examples of these disorders include cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, Reynaud's disease, rhematoid arthritis, angina, myocardial infarctions, thrombophlebitis and lymphangitis. The PRO polypeptides and antagonists are also used to prevent tumour angiogenesis and for treating deriodontal diseases. They are also used to stimulate wound healing and tissue regeneration. The PRO nucleic acids, polypeptides and anti-pRO antibodies are useful for diagnosing a cardiovascular, endothelial or

angiogenic disorder

Seventeen nucleic acids encoding PRO polypeptides which are useful in diagnosis and treatment of cardiovascular, endothelial or anglogenic

The present sequence is that of novel human immunomodulator PR0364 (UN0319), as deduced from cDNA (see AAF30057) isolated from a small intestine library. PR0364 (26 Kba, p16.34) shows sequence homology to mouse GITR protein and may be lits human counterpart. The invention provides polynuclectides (see AAF30050-62) encoding novel human PKO proteins (see AAB20108-20) including PR0364.

Claimed compositions comprising these proteins or their agonists are useful for increasing infiltration of inflammatory cells into a tissue of a mammal, stimulating or enhancing an immune a tissue of a mammal, stimulating or enhancing an immune response, or increasing the proliferation of T-lymphocytes in a mammal in response to an antigon. Claimed compositions comprising a proposite of the proliferation of T-lymphocytes in a mammal in response to an antigonist have the opposite effect. A claimed method for treating an immune related disorder, such as a proceed involves administering a PR0 polypeptide, an agonist antibody or an antigonist antibody. The disorder is selected from systemic lupus erythemators rhematois arthritis, spendyloarthropathy, systemic sclerosis, juvenile chronic arthritis, spondyloarthropathy, systemic sclerosis, thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated cutofinmune chronic active hepatitis, primary billary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel cliseases (auch as multiple sclerosis), gucton as multiple sclerosis, allergic thinitis, actoric as stime, allergic chinitis, diseases, erythema multiforme and psoriasis), allergic diseases (the lung and transplantation associated diseases (such as antimed methods of diagnosing these disorders comprise detecting the lung and cransplantation associated diseases (such as graftma, allergic chined methods of diagnosing these disorders comprise detecting the lung and cransplantation associated diseases (such as relating the expectation and graft-versus-host diseases) (all claimed methods of diagnosing these dis
                                                                                                                                                                                                                                 Gurney AL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Godowski PJ, Gurney Al

```
This sequence represents PR0364 polypeptide, which is a human glucocatiood-induced tumor necrosis factor receptor (hGTTR). The cortseponding ligand (hGTTRL), PR0175, is given in AAB47056.

PR0364 and PR0175 may be used in a mixture with a cardiovascular, endothelial, angiogenic or angiostatic agent for the treatment of a cardiovascular, endothelial, angiogenic or angiostatic disorder. The PR0364 cDNA sequence was isolated from an expressed sequence tag (EST) database as having homology to members of the tumour necrosis factor receptor (TNFR) family of polypeptides. The PR0175 cDNA sequence was isolated from a library of cDNA fragments derived from human umbilical vein endothelial cells (HUVEC). Administering an effective amount of PR0364 or PR0175 or their antagonists is useful for treating cardiac hypertrophy (which is initiated by myocardial infarction and characterized by the presence of an elevated level of PGE_2alpha), trauma, a cancer, or age-related macular degeneration in a human. Administering a therapeutically effective amount of an antibody that chinds PR0364 or PR0175 is useful for inhibiting angiogenessis induced by PR0364 or PR0175 in a human suffering from a tumor or a retinal coll sufficer. PR0364 or PR0175 to their antagonists, are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition for diagnosing and treating cardiovascular, endothelial and angiogenic disorders, comprises a PRO364 or PRO175 polypeptide -

The present sequence is that of human tumour necrosis factor receptor-like protein TR11 (see also AAY95879), a novel protein receptor-like protein TR11 (see also AAY95879), a novel protein showing identity to murine glucocorticoid induced tumour necrosis factor receptor family-related gene. The invention provides highly conserved TR11, TR115V1 and TR115V2 proteins (see AAY95879-81), as well as vectors, host cells and recombinant methods for their production. TR11, TR115V1 and/or TR115V2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency, (SCID), Wiskott-Aldrich syndrome or X-linked immunodeficiency deficiency with hyper IgM. TR115V1 and/or TR115V2 candor diagnose an autoimmune disease, especially rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diagnosis; trauma; wound; cancer; atherosclerosis; cardiac hypertrophy; anglogenic; proliferative; cardiant; cardiovascular; antiatherosclerotic; cytostatic; gene therapy; vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                 useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenic disorder in mammals by and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or anglogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCS) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. The present sequence is the human PRO364 protein, encoded by the cDNA clone, designated as DNA47365-1206. It is isolated from human small intestine tissue cDNA library, identified using probes based on the consensus sequence DNA44825, relative to the Incyte expressed sequence tag (EST) 3003460. This EST has homology to tumour necrosis factor receptor (TNRR) family of polypeptides. PRO364 sequence also shows homology to members of the TNRR family and mouse GITR protein. This clone is assigned the ATCC deposit No: 209436. PRO364 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PRO655, PRO364 and PRO344. This composition is especially useful for treatment of human cancers such as breast, prostate, colon, lung, renal, ovarian and CNS, leukemia and melanoma.
CNS; leukemia; melanoma; Expressed Sequence Tag; EST; TNFR homologue;
tumour necrosis factor receptor; GITR protein homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          for
